

EXERCISE FOUR

MEDIA QUERIES

1. First **define the device-width** in the head of your HTML document. Include the following in the <head> of your html document:

```
<meta name="viewport" content="width=device-width,  
initial-scale=1.0">
```

The width=device-width part sets the width of the page to follow the screen-width of the device (which will vary depending on the device). The initial-scale=1.0 part sets the initial zoom level when the page is first loaded by the browser.

2. **Create at least one media query** for a smaller screen size. You are also welcome to do more than one breaking point. You could try the following sizes:

```
@media only screen and (max-width: 400px) {} /* smaller than mobile */  
@media only screen and (max-width: 750px) {} /* smaller than tablet */  
@media only screen and (max-width: 1000px) {} /* smaller than desk */
```

5. Add a media query to change the width of columns on a mobile device:

```
#wrapper {  
width: 80%;  
margin: auto;  
}  
  
.column {  
width: 33.33%;  
float: left;  
margin: 10%;  
}  
  
@media only screen and (max-width: 400px) {  
  
.column {  
width: 100%;  
float: left;
```

```
margin: 0%;  
}  
}
```
